

While a home surge arrester placed on the meter is effective in protecting homes from transient voltage, it is also highly recommended to use “point of use” surge protectors on electrical equipment inside the home.

Because transient voltage can enter the home in a multitude of ways, adding layers of surge protection increases the protection of electrical equipment and your home overall. If the transient voltage enters from a point other than the meter, using “point of use” surge protectors will give you peace of mind that you are protecting your electrical equipment to the best of your ability.

The following surge protectors are available for purchase at a special member price. Contact [Amanda Shipman](#) at (325) 793-8559 for more information.
